

VISUALIZING PROGRAM DYNAMICS ARRAYS

Problem Solving with Computers-I

<https://ucsb-cs16-wi17.github.io/>

C++

```
#include <iostream>
using namespace std;

int main(){
    cout<<"Hola Facebook\n";
    return 0;
}
```

Reflecting on the midterm

- The question paper is on the course website: <https://ucsb-cs16-wi17.github.io/exam/e01/>
- Overall – it was a good performance! Mean: 85.57%, median 87.33%, std. deviation: 9.68%
- Lab04 is now available – all about arrays!
- Hw08 is also all about arrays and tracing code!

Memory and C++ programs

“The overwhelming majority of program bugs and computer crashes stem from problems of memory access... Such memory-related problems are also notoriously difficult to debug. Yet the role that memory plays in C and C++ programming is a subject often overlooked.... Most professional programmers learn about memory entirely through experience of the trouble it causes.”

.... Frantisek Franek
(Memory as a programming concept)

Model of memory

- Sequence of adjacent cells
- Each cell has bits stored in it
- Each cell has an address (memory location)

Interaction of programs with memory

Consider the declaration: `int x;` // Assume starting location of 'x' is 0

Memory map below would result from which of the following C++ statements?

0	0xFF
1	0xFF
2	0xFF
3	0xFE
4	0x01
5	0x02
6	0x03
7	0x04

A. `int x = 0xFF;`

B. `int x = 0xFE;`

C. `int x = 0xFFFFFFFFFE;`

D. `int x = -2;`

E. Both C and D

State of memory after code execution

Tracing code

Show how the state of memory is modified when the following C++ code is executed?

0	0xFF
1	0xFF
2	0xFF
3	0xFE
4	0x01
5	0x02
6	0x03
7	0x04

State of memory

```
int x = 1; // Assume x is at location 0
char y;    // Assume y is at location 7
if (x > 0)
    x++;
else
    y++;
```

Drawing memory maps to trace code

- Trace the code below by drawing memory diagrams
- Choose the level of abstraction in your diagram that's right for this context!

0	0xFF
1	0xFF
2	0xFF
3	0xFE
4	0xA1
5	0xC2
6	0x00
7	0x04

```
char x = -2;  
char y = 4;  
char tmp = x;  
x = y;  
Y = tmp;
```

C++ Arrays

A C++ array is a **list of elements** that share the same name, have the same data type and are located adjacent to each other in memory

arr

10
20
30
40
50
60
70
80

arr

10	20	30	40	50	60	70	80
----	----	----	----	----	----	----	----

Declaring C++ arrays

```
int arr[5] ;
```

// declares a 5-element integer array

Declaring and initializing C++ arrays

// Declare a 5-element integer array and fill it with values

```
int arr[5]={10, 20, 30, 40, 50};
```

What is the memory location of each element?

arr	10	20	30	40	50
-----	----	----	----	----	----

```
int arr[5]={10, 20, 30, 40, 50};
```

If the starting location of the array is 0x200, what is memory location of element at index 2?

- A. 0x201
- B. 0x202
- C. 0x204
- D. 0x208

Accessing elements of an array

```
int arr[]={1,2,3} ; // declare and initialize  
//Access each element and reassign its value to 5
```

Most common array pitfall- out of bound access

```
int arr[]={1,2,3} ; // declare and initialize  
arr[3] = 5;
```

Using variables as array subscripts

```
int arr[]={1,2,3};
```

```
//increment each element of the array
```

Tracing code involving arrays

```
int arr[]={1,2,3};  
int tmp = arr[0];  
arr[0] = arr[2];  
arr[2] = tmp;
```

Choose the resulting array after the code is executed

A.

1	2	3
arr[0]	arr[1]	arr[2]

B.

2	1	3
arr[0]	arr[1]	arr[2]

C.

3	2	1
arr[0]	arr[1]	arr[2]

D. None of the above

Arrays – motivating example

DEMO: Write a program to store 5 scores and calculate the average of the 5 scores.

Next time

- Pointers
- Mechanics of function calls – call by value and call by reference
