GIT AND GITHUB, C++ DATA TYPES BASIC CONTROL FLOW

Problem Solving with Computers-I

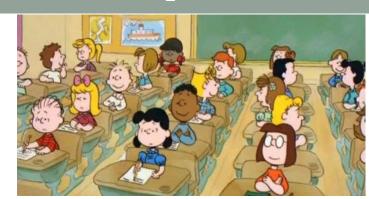

https://ucsb-cs16-wi17.github.io/

Announcements

- Submit your homework 1
- Homework 2 has been released
- Reading for homework is due before each class
- Reminder about our policy on electronic devices
- Cookies during office hours come visit!!
- Some comments on labs:
 - Please make sure you read ALL the information in the lab write up prior to coming to section
 - Start looking for partners to pair with in your section (for lab01) –
 We recommend using Piazza

Which of the reasons best describes why you are taking this class?

- A. You are a CS/CE major, and will be taking follow up classes
- B. You are NOT a CS/CE major, but are contemplating on switching into CS or CE
- C. Your major requires you to take the class. You are NOT a CS/CE major, are NOT contemplating on switching into CS or CE.
- D. Other Just curious

What is Git and Github?

- Git is an example of "version control"
- Git performs version control on "repositories"
- Repository (repo) is just a collection of files
- Github is a repository hosting service for Git

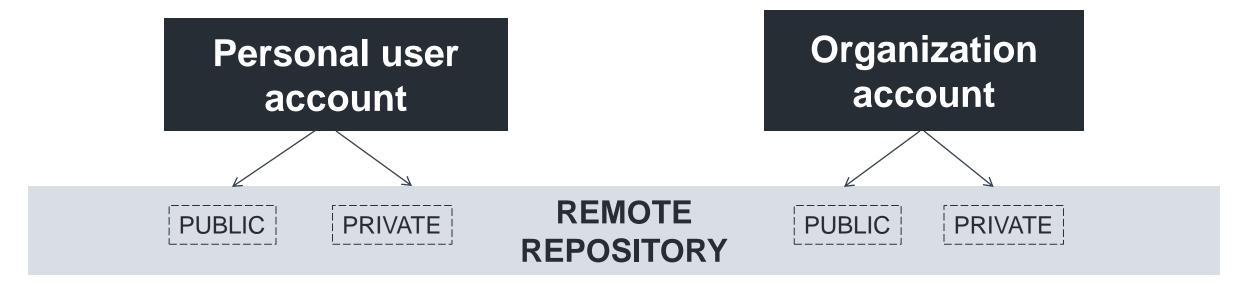

Q: Can you suggest ways to store the three different versions of hello.cpp shown on the right?

```
#include<iostream>
int main() {
}
```

```
#include<iostream>
int main() {
   cout<<"Hello World";
}</pre>
```

```
#include<iostream>
int main(){
   cout<<"Hello World"<<endl;
   return 0;
}</pre>
```

Github Structure

- Unlimited public repositories and collaborators on all plans
- Limited private repositories
- Ability to add unlimited repository collaborators

- Organizations are great for projects that need multiple owners & admins.
- Private repositories
- Team-based access permissions

Demo: creating a new repo in our class organization!

Cloning Repos

REMOTE REPOSITORY

LOCAL REPOSITORY

Demo: Cloning a repo to CSIL servers and why that's useful

Clickers out – frequency AB

Which code produces a compile-time error?

```
A. int main(){
    cout<<"Enter two numbers:";
    cin>>a >> b;
    cout<<"The sum of "<< a << " and " << b<< " is:"<< a+b<<endl;
}</pre>
```

```
B. int main(){
    int a, b;
    cout<<"The sum of "<< a << " and " << b<< " is:"<< a+b<<endl;
}</pre>
```

C. Both A and B

D. Neither A or B

C++ Variables and Datatypes

- Variables are containers to store data
- C++ variables must be "declared" before they are used by specifying a datatype
 - int: Integers
 - double: floating point numbers
 - char: characters

```
int main() {
    cout<<"Enter two numbers:";
    cin>>a >> b;
    cout<<"The sum of "<< a << " and " << b<< " is:"<< a+b<<endl;
}</pre>
```

C++ Uninitialized Variables

- Value of uninitialized variables is "undefined"
- Undefined means "anything goes"
- Can be a source of tricky bugs
- What is the output of the code below?

```
int main() {
    int a, b;
    cout<<"The sum of "<< a << " and " << b<< " is:"<< a+b<<endl;
}
```

The values of variables can be initialized...

...or changed on the fly...

```
int myVariable = 0;
myVariable = 5 + 2;
```

...or even be used to update the same variable!

```
int myVariable = 0;
myVariable = 5 + 2;
myVariable = 10 - myVariable;
myVariable = myVariable==0;
```

...or even be used to update the same variable!

```
int myVariable = 0;
myVariable = 5 + 2;
myVariable = 10 - myVariable;
myVariable = myVariable==0;
```

Control Flow: if

- Find the main differences in each case
- Write the generalized if statement for each case

In Python

In C++

```
if True:
    itIsTrue()

if (true)
    itIsTrue();

if True:
    if (true){
    itIsTrue();
    itIsTrue();
    itIsAlsoTrue()
    itIsAlsoTrue();
}
```

Generalized if statement

- The condition is a Boolean expression
- These can use relational operators

```
if (1 < 2) {
  cout << "foo";
}

if (2 == 3) {
  cout << "foo";
}</pre>
```

```
if ( condition ) {
   // statement 1;
   // statement 2;
}
```

Fill in the 'if' condition to detect numbers divisible by 3

```
A. x/3 == 0
B. ! (x%3)
C. x%3 == 0
```

- D. Either B or C
- E. None of the above

```
if ( _____ )
  cout<< x << "is divisible by 3 \n" ;
}</pre>
```

Will both code instances give the same output?

- A. Yes because they have equivalent logic
- B. Yes, even though the logic is not equivalent
- C. No because the logic is not equivalent
- D. One will produce a compile-time error

```
int myVar =0;

if (myVar ==0)
    cout<<"inside if\n";

cout<<"outside if \n";

cout<<"outside if \n";</pre>
```

Control Flow: if-else

```
if (cond) {
    doOnTrue()
    doThisAlso();
} else {
    doOnFalse();
    doThisAlso();
}
```

Can you write this code in a more compact way

Control Flow: for loops

```
int x;
for (x = 0; x < 50; x++)
 oneStatement(x);
for ( x = 0; x < 50; x++ ) {
  statementOne();
  statementTwo();
```
